

AN-103 Enterprise Support (many sites) With The Elite System

The Elite System can be used in a number of ways that is specifically designed to help users with many separated sites.

Typical applications for “enterprise” users of the Elite System are;

1. A main company has many remote contractors. The remote contractors collect data and eMail it to the main contractor for reporting and corroboration of billings.
2. A company has many state offices. Each state office does its own reports. Additionally, head office needs to perform its own reports. This is done by eMailing raw unloaded data files and running independent report programs.
3. New systems being developed by Elite-ID enable totally web page based reporting systems to be located at the site of data collection and provide controlled web access to the internet.
4. New reporting process provide performance monitoring against real-time collected data and the generation and transmission of reports when and if performance does not meet requirements.

New Generation Systems

Elite-ID has invested heavily in creating new generation data logging, extraction, reporting and archiving systems that provide users with dramatically new facilities.

For wide-spread users of the Elite System, data collection, storage, reporting and archival has never been easier.

Data Files

Central to the design of the Elite System is the way data is extracted and used to generate reports. The Elite System provides great flexibility.

This method is ideal for clients having multiple and wide spread sites. It allows collection of the data at a site and also the efficient transmission of data to a remote site (such as a head office) for centralized as well as local reporting.

Built into the data is a system of integrity checks that assures accuracy and integrity.
