

AN_109 identiMESH Reports Overview

The identiMESH system is a real-time data collection and reporting system that is highly configurable into a number of roles. By default the system turns on reports and exception processing that generates the reports as web-pages.

The main "index" page offers the following reports;

Exceptions	This is a list of locations that are currently in exception. In other words, failed to meet performance criteria you have input.
Locations	This is an advanced report that shows information about each location. This includes; Name of the location, Serial No assigned, Profile in use – that defines the locations processing options, Today - number of hits this day, L-Hr - number of hits in the last hour, L-15 - number of hits in the last 15 minutes, L-Hit – Time of the last hit, Delay – Number of minutes since the last hit, Exception (Qty - Ave) – number of exceptions and average minutes, Cv % - the coverage percentage calculation, Ret Time – the return time calculation (two off)
Locations- Gap Report	This is a list of all gaps in attendances greater than the return time and when they happened by time of day.
Wands	This shows the number of hits, first hit and last hit and battery status for each wand.
Unloaders	This shows current status and the number of hits unloaded today.
Home-Dates	This shows the hits by date for the data unloaded today.
Home-Profiles	This shows information about the profiles for location processing
Home-Errors	Diagnostic - some parts of the program may report error information
Home-History	Diagnostic – a history of the last 50 data items read
Home-Hits by hour	A simple report showing amount of data by hour
Battery Performance	A running list of battery monitoring data showing date, time and voltage
Home-Kiddie Badge Movements	This is a dual report; Firstly it shows the "last seen at" list for each badge – the location that each badge was last seen at. Next it shows a running list of locations by badge.
